

Evaluation and qualification of your network equipment

YOUR CHALLENGES

Evaluate and validate the reliability of your equipment, with regard to the technical specifications of gas infrastructure operators and regulatory requirements.

OUR VALUE-ADDED SKILLS

- Design and performance of gas tests of all types of network equipment, in real operating conditions and control of service conditions (pressure up to 60 bar; flow rate up to 10,000 m³(n)/h; ambient temperature between -20°C and +60°C)
- FenHYx test bench to test the impact of different hydrogen mixtures on equipment (sealing, manoeuvring torque, ageing)
- Analysis and expertise of equipment found to be defective on the network.

OUR REFERENCES

- Qualification of gas pressure regulators and safety accessories
- Qualification of biomethane injection stations for distribution and transport
- Valve function tests in the presence of hydrogen.
- Function test of a countdown station through a configuration of test benches simulating a "gas region" with transmission network, distribution network, biomethane injection and customer consumption.
